HOMWORK NO. 1

Problem 1

Sodium oxide ( $\text{Na}_2\text{O}$ ) is an ionic solid that exhibits the crystal structure shown in Fig. 1. The  $\text{O}^{2-}$  ions occupy the atom sites of an FCC structure while the  $\text{Na}^+$  ions occupy all of the tetrahedral interstitial sites of the anion FCC structure.

Fig. 1 The unit cell of  $\text{Na}_2\text{O}$ .

- (3%) (a) Give the number of  $\text{Na}^+$  ions per unit cell.
- (3%) (b) Give the number of  $\text{O}^{2-}$  ions per unit cell.
- (3%) (c) How many  $\text{O}^{2-}$  ions surround a  $\text{Na}^+$  ion?
- (3%) (d) How many  $\text{Na}^+$  ions surround an  $\text{O}^{2-}$  ion?
- (3%) (e) On which Bravais lattice is the crystal structure of  $\text{Na}_2\text{O}$  based?
- (3%) (f) Give the number of  $\text{Na}^+$  ions and the number of  $\text{O}^{2-}$  ions in the basis.

- (6%) (g) The lattice constant is  $a$ , as indicate in Fig. 1. Give the relationship between  $a$  and the cation radius  $r$  and the anion radius  $R$ .
- (10%) (h) Calculate the density of  $\text{Na}_2\text{O}$ .

### Problem 2

Consider the two-dimensional space lattice shown in Fig. 2, where the parallelogram shown by solid lines is a unit cell. All four edges of the parallelogram are equal in length. The hexagon shown by dashed lines is another unit cell.

Fig. 2 A two-dimensional space lattice.

- (3%) (a) Give the number of lattice points per unit cell for the parallelogram unit cell.
- (3%) (b) Give the number of lattice points per unit cell for the hexagonal unit cell.
- (3%) (c) Which unit cell is the primitive unit cell?
- (13%) (d) A hypothetical two-dimensional crystal structure is based on the lattice shown in Fig. 2, and has two atoms in the basis. The positions of the two atoms associated with the lattice point A are indicated by X in Fig. 3. One atom in the basis is at the lattice point A; the other atom in the basis is at point B, which is such that the distance AB is  $1/3$  of the distance AC. By repeating the basis at every lattice point, sketch the crystal structure.

Fig. 3 A basis for the lattice of Fig. 2.

- (6%) (e) What is the coordination number of the two-dimensional crystal structure obtained in (d)?
- (6%) (f) The lattice constant is  $a$ , as indicated in Fig. 2. Assume that nearest neighbor atoms touch each other in this crystal structure, give the relationship between  $a$  and the atomic radius  $r$ .

Problem 3

Lead is FCC with atomic radius  $1.750 \text{ \AA}$ . What is the volume of its unit cell?

Problem 4

Magnesium is HCP and has nearly spherical atoms with a radius of  $\sim 1.61 \text{ \AA}$ . What is its density? For Mg,  $\frac{c}{a} = 1.62$ . Hint:  $a = 2r$  for HCP.

Problem 5

The electron energy levels for a copper atom are  $E_K = -8982 \text{ eV}$ ,  $E_L = -933 \text{ eV}$ , and  $E_M = -75 \text{ eV}$ . Calculate (a) the  $K_\alpha$  photon energy, (b) the  $K_\beta$  photon energy, (c) the  $L_\alpha$  photon energy, (d) the KLL Auger electron energy, and (e) the LMM Auger electron energy.

Problem 6

The K shell electron energy for nickel is  $E_K = -8333 \text{ eV}$  and the wavelengths of the  $\text{Ni}K_\alpha$  and  $\text{Ni}K_\beta$  photons are  $0.1660 \text{ nm}$  and  $0.1500 \text{ nm}$ , respectively. (a) Draw an energy-level diagram for a nickel atom. Calculate (b) the KLL and (c) the LMM Auger electron energies for nickel.
